1. INTRODUCTION

1.1 Overview:

A vehicle that can be powered by an electric motor that draws electricity from a battery and is capable of being charged from an external source and have an electric motor instead of an internal combustion engine. The Electric Vehicle (EV) is not new, but it has been receiving significantly more attention in recent years. Advances in both EV analytics and battery technologies have led to increased automotive market share. However, this growth is not attributed to hardware alone. The modern mechatronic vehicle marries electrical storage and propulsion systems with electronic sensors, controls, and actuators, integrated closely with software, secure data transfer, and data analysis, to form a comprehensive transportation solution. Advances in all these areas have contributed to the overall rise of EV's, but the common thread that runs through all these elements is data analytics. The new EV's are combined Electrical storage and propulsion systems with electronic sensors, controls, and actuators, integrated closely with software, secure data transfer to form a comprehensive transportation solution.

1.2 USE OF THIS PROJECT:

This project used for “ELECTRIC VEHICLE” in problem defining, understanding the problem, specify the business problem, Requirements of business, literature survey and business impact. Through this project we learned how to do data preparation and how to visualize data produced. In this project helps for creating the dashboard and the story using the visualization. We learned how to upload the prepared dashboard and story to the web. Through this project have learned the charge and range analysis for electric vehicles. This project helps for how to handle many software. Also, this project contains many uses full details.

2. PROBLEM DEFINITION & DESIGN THINKING

2.1 EMPATHY MAP:

Template

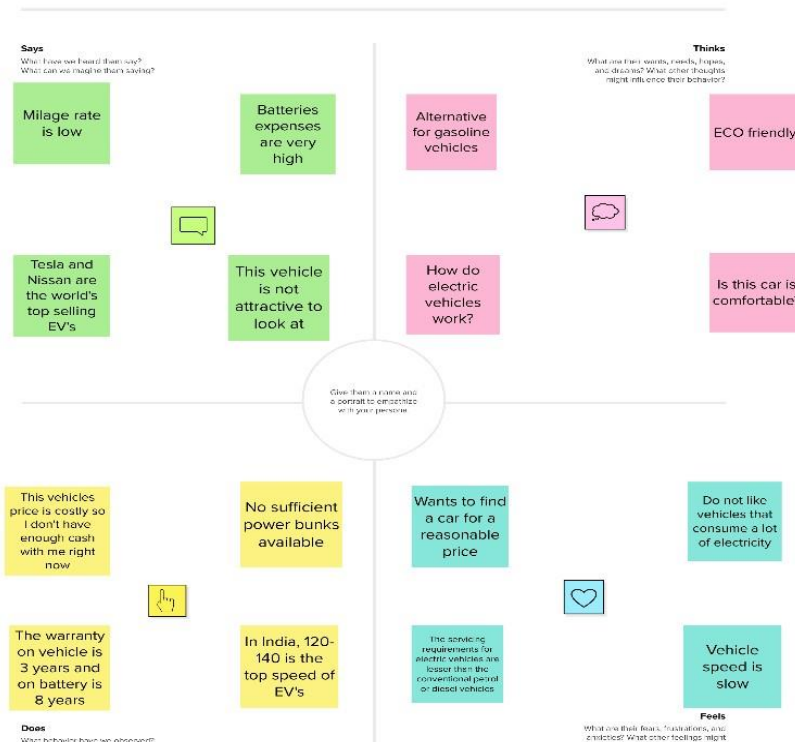

Empathy map

Use this framework to develop a deep, shared understanding and empathy for other people. An empathy map helps describe the aspects of a user's experience, needs and pain points, to quickly understand your users' experience and mindset.

[Share template feedback](#)

Build empathy

The information you add here should be representative of the observations and research you've done about your users.

Says
What have I said I want? What can we imagine them saying?

Mileage rate is low

Batteries expenses are very high

Alternative for gasoline vehicles

ECO friendly

Tesla and Nissan are the world's top selling EV's

This vehicle is not attractive to look at

How do electric vehicles work?

Is this car is comfortable?

Thinks
What are their wants, needs, hopes, and dreams? What other thoughts might influence their behavior?

Does
What behavior have we observed? What can we link to them doing?

This vehicles price is costly so I don't have enough cash with me right now

No sufficient power bunks available

Wants to find a car for a reasonable price

Do not like vehicles that consume a lot of electricity

The warranty on vehicle is 3 years and on battery is 8 years

In India, 120-140 is the top speed of EV's

The servicing requirements for electric vehicles are lesser than the conventional petrol or diesel vehicles

Vehicle speed is slow

Feels
What are their fears, frustrations, and emotions? What other feelings might influence their behavior?

Need some inspiration?

See a finished version of this template to kickstart your work.

2.2 IDEATION & BRAINSTORMING MAP:

Brainstorm & Idea prioritization

Use the template in your own brainstorming session as your team can develop their ideas and select the concept which will guide the design in the later steps

- 1. Brainstorm concept
- 2. Select the best idea
- 3. Develop the idea

Before you collaborate

1. Define the problem or issue to be solved

2. Define the scope of the problem

3. Define the objectives

4. Define the constraints

5. Define the resources

6. Define the timeline

7. Define the roles

8. Define the communication

9. Define the evaluation

10. Define the feedback

Define your problem statement

1. Define the problem or issue to be solved

2. Define the scope of the problem

3. Define the objectives

4. Define the constraints

5. Define the resources

6. Define the timeline

7. Define the roles

8. Define the communication

9. Define the evaluation

10. Define the feedback

Brainstorm

1. Define the problem or issue to be solved

2. Define the scope of the problem

3. Define the objectives

4. Define the constraints

5. Define the resources

6. Define the timeline

7. Define the roles

8. Define the communication

9. Define the evaluation

10. Define the feedback

Group ideas

1. Define the problem or issue to be solved

2. Define the scope of the problem

3. Define the objectives

4. Define the constraints

5. Define the resources

6. Define the timeline

7. Define the roles

8. Define the communication

9. Define the evaluation

10. Define the feedback

Prioritize

1. Define the problem or issue to be solved

2. Define the scope of the problem

3. Define the objectives

4. Define the constraints

5. Define the resources

6. Define the timeline

7. Define the roles

8. Define the communication

9. Define the evaluation

10. Define the feedback

After you collaborate

1. Define the problem or issue to be solved

2. Define the scope of the problem

3. Define the objectives

4. Define the constraints

5. Define the resources

6. Define the timeline

7. Define the roles

8. Define the communication

9. Define the evaluation

10. Define the feedback

Fear of buying electric vehicles

- # Promote more advertisement of electric vehicles
- # Make clear statement about the vehicle
- # Clarify the myth about the electric vehicles
- # Explain how the electric vehicles are better than gasoline vehicles

Problem on charging the electric vehicles

- # Decrease the time of charging by improving the charging technology
- # Recharge on any car parking or even on a departmental store
- # Installation of more charging bunks
- # Increase the energy density of the battery

Battery issues

- # Explain how the battery works and how to maintain them properly
- # Highly insulate the battery for protection on different climatic conditions
- # Dispose the battery safely
- # Use different material for battery

4. ADVANTAGES AND DISADVANTAGES

4.1 ADVANTAGES:

Eco -friendly: Because electric vehicles do not utilize fuel for combustion, there are no emissions or gas exhaust. Vehicles that run on fossil fuels contribute significantly to hazardous gas accumulation in the environment, thus driving an electric car can help contribute to a cleaner environment.

Renewable energy source: Electric vehicles run on renewable power, whereas conventional automobiles function on the combustion of fossil fuels, which reduces the world's fossil-fuel stocks.

Less noise and smoother motion: Driving an electric car is significantly smoother. Because they lack fast-moving elements, they are quieter and produce less noise.

Cost-effective: Electricity is far less expensive than fuels such as gasoline and diesel, which are subject to regular price increases. When solar electricity is utilized at home, battery recharging is cost-effective.

Low maintenance: Because electric cars have fewer moving components, wear and tear is reduced when compared to traditional auto parts. Repairs are also simpler and less expensive than combustion engines.

4.2 DISADVANTAGES:

High initial cost: Electric vehicles continue to be quite expensive, and many buyers believe they are not as inexpensive as traditional automobiles.

Charging station limitations: People who need to travel long distances are concerned about finding adequate charging stations in the middle of their journey, which are not always accessible.

Recharging takes time: Unlike conventional automobiles, which require only a few minutes to replenish their gas tanks, charging an electric vehicle takes many hours.

Limited options: Currently, there aren't many electric car models to pick from in terms of appearance, style, or customized variations.

Less driving range: When compared to conventional automobiles, electric vehicles have a shorter driving range. Electric cars can be convenient for short-distance travel but are

5. APPLICATIONS

- It helps to know the region and type wise charging station in india .
- Total different electric cars in India list out. ➤ Top speed for Different Brands.
- Price for different cars in india
- Top10 most efficient electric vehicle brands.
- Brands according to Bodystyle.
- Brand filtered by Power train type.
- No of modals by each brand
- Summary Cards for Different brands of EV cars globally.
- Summary Cards for Different brands of EV cars in india.

6. CONCLUSION

This project provides many details for electric Vehicle so it's help for buying electric cars. This project helps for our future because we handle for many software and specify business problem defining and problem understanding. Comparing the many brands and the best reasonable EV Cars. Although electric vehicle must solve the hurdles that are currently preventing people from purchasing, the future is clear. Evs will outlast gas powered automobiles in the in the long run. Both GM and Nissan declared in January 2021 that they will go all- electric by the 2030s. other automakers will undoubtedly follow suit

7. FUTURE SCOPE

There are no emissions:

Electric automobiles are being developed primarily because they do not emit any pollution when driving. An electric vehicle is propelled by a battery-powered electric motor. There is no burning of fuel. An electric vehicle does not have an exhaust system. It's the best road transportation solution at a time when global CO₂ emissions and air pollution must be drastically cut.

Access to city centres is unrestricted:

Aside from the fact that more cities are implementing LEZs, these zones are also growing in size and strictness with time. With an electric car, you have limitless access to low-emission zones, now and in the future, wherever and whenever you want.

Electricity is less expensive than gasoline:

Electricity is less expensive than gasoline and fuel. In this regard, an electric automobile is less expensive than a car with a combustion engine. The most cost-effective solution is to charge at home.

Comfortable and quiet:

Unlike a combustion engine, an electric motor produces very little noise. As a result, the silence inside an electric vehicle is unmistakable. Additionally, unlike a combustion engine, an electric motor does not produce any vibrations or resonance. The vibration-free and silent drivetrain adds to the relaxation.

There's no need to switch gears:

An electric automobile does not have a traditional gearbox, which is another key distinction from a car with a combustion engine. An electric car always works like a car with an automatic transmission, which eliminates the need to shift gears. You also don't have to pay more for it. Driving in busy start-stop traffic in the city or traffic congestion has never been more comfortable, thanks to the quietness of an electric motor.

Torque on the fly:

The incredibly high torque of an electric motor is a distinct feature. Much more powerful than a typical internal combustion engine. Furthermore, an electric motor responds rapidly to throttle motions and generates peak torque right from a standstill. Internal combustion engines have an unavoidable response time and can only generate maximum torque in a specific speed range. All of this assures enticing performance thanks to the smooth and powerful acceleration, as well as a great deal of driving pleasure.

Extremely effective:

At the moment, the most efficient combustion engines have an efficiency of around 40%. That means they only put 40% of the energy in the fuel into motion. Heat and friction account for the remaining 60%.

An electric motor has a 90 per cent efficiency, which means it uses the battery's energy far more efficiently. Furthermore, because an electric motor can be transformed into a generator in the blink of an eye, an electric car can swiftly recover kinetic energy.

Requires less maintenance:

Electric drivetrain technology is much simpler than that of a combustion engine. Because only a few sections need to be lubricated, it has far fewer (spinning) parts and fluids. So, as you may have guessed, an electric vehicle requires less maintenance.

Generate your power:

Having your oil refinery in your garden to make your auto fuel is impossible. It's hardly unexpected, though, that you can create your electricity. For example, solar panels on the top of your home or office building can provide energy. You may further lower your kilometre cost by charging your battery with this renewable energy.
